

Cohort 2 of the MEGA Program: Basic economic facts, 2006

Gordana Vukotić-Cotić, Institute of Economic Sciences, Belgrade, Serbia

KEY WORDS: EU Employment, unemployment, new job opportunities

JEL : R11

Abstract: *The MEGA Program is funded by the United States Agency for International Development, and implemented by the Urban Institute from Washington DC. Its objective is, in short, to enable local governments and local businesses in Serbia to foster economic growth not only in the participating municipalities but also, through the effect of keeping up with them, in all others. The eleven municipalities that joined the Program in its second stage, referred to as Cohort 2, exhibited a weak economic performance in 2006, as the baseline year. In comparison with Serbia, the majority of these municipalities had a lower share of women in employment (in total, and by enterprises and entrepreneurs), and a higher share of women in unemployment. The unemployment rates in total and for women in particular, were high everywhere. Only for two municipalities were they lower than for Serbia. At last but not the least, new enterprises and new entrepreneurs were established, for the most part, in the wholesale and retail trade – which is not crucial for the economic growth of impoverished areas.*

Introduction

The MEGA Program is funded by the United States Agency for International Development, and implemented by the Urban Institute from Washington DC. Its objective is, in short, to enable local governments and local businesses in Serbia to foster economic growth not only in the participating municipalities but also, through the effect of keeping up with them, in all others. (MEGA is the acronym from the *Municipal Economic Growth Activity*.)

The Program has been fully operative since January 2006. It has two stages so far:

- In the first stage, ten municipalities were chosen to participate in the Program: Indjija, Kragujevac, Krusevac, Loznica, Novi Beograd, Prokuplje, Subotica, Uzice, Vranje and Zrenjanin. As a whole, they are referred to as Cohort 1. Changes in the economic performance of the municipalities within Cohort 1 in the course of time have to be assessed in relation to the baseline year 2005.
- In the second stage, additional eleven municipalities joined the Program: Arilje, Cacak, Kraljevo, Leskovac, Pancevo, Paracin, Pecinci, Prijepolje, Sabac, Smedervo and Vrsac. As a whole, they are regarded as Cohort 2. Changes in the economic performance of the municipalities within Cohort 2 over time have to be evaluated with reference to the baseline year 2006.

The economic position of the municipalities within Cohort 1 in the baseline year 2005 and its changes up to March 2007 have been already assessed.

This paper – which has been also supported by the Ministry of Science and the Protection of Human Environment of the Government of the Republic of Serbia within its program for the period 2005–2007 – will deal with basic economic facts on the municipalities within Cohort 2 in the baseline year 2006.

As the dissemination of official data at lower levels of aggregation is aggravated in case of Serbia, the aforementioned basic economic facts involve four variables only: the employed, the

unemployed, new enterprises and new entrepreneurs. The data on the variables in question are released by: the Statistical Office, the National Employment Service and the Business Registers Agency of the Republic of Serbia.

Employment and unemployment

Employment, unemployment and the labor force, in total and for women, relating to Serbia and Cohort 2 in 2006, are presented in Tables 1–3 as the simple arithmetic means of the corresponding values of 31 March and 30 September. Employment includes persons who are employed in enterprises, on the one hand; and entrepreneurs, with or without employees, on the other hand. Consequently, and unfortunately, it excludes farmers. Enterprises are taken in a broader sense: they cover small, medium and large firms – as well as cooperatives, institutions and organizations. Unemployment comprises persons who are registered as unemployed, although they might have been occasionally or informally employed. This concept of unemployment differs, therefore, from that adopted by the International Labor Organization. The labor force is defined as the sum of the employed and the registered unemployed.

The female participation in employment is displayed on Charts 1–3. It was higher than the male participation only in terms of entrepreneurs in Cacak exclusively. Six municipalities within Cohort 2 were ranked lower than Serbia in respect of the portion of women employed with enterprises and entrepreneurs taken separately. On the other hand, seven municipalities within Cohort 2 were ranked lower than Serbia in respect of the portion of women employed with enterprises and entrepreneurs taken together. Smederevo, with the leading role of the US Steel in its economy, was at the bottom of the list in each case.

Chart 3. Female participation in the employment with entrepreneurs (%): 2006

Source: Table 1

The female participation in unemployment is shown on Chart 4. Only in Pecinci was the share of unemployed women lower than the share of unemployed men. Six municipalities within Cohort 2 had a higher rank than Serbia. Among these municipalities, Smederevo was at the top of the list.

Chart 4. Female participation in unemployment (%): 2006

Source: Table 2

The female participation in the labor force is given on Chart 5. It was lower than the male participation both for Serbia and all the municipalities within Cohort 2. In comparison with Serbia, a lower share of women in the labor force was recorded for six municipalities within Cohort 2.

Chart 5. Female participation in the labor force (%): 2006

Source: Table 3

The rates of employment and unemployment, in total and for women, are presented in Table 4. The rate of the total employment is calculated as a percentage ratio of all the employed to the total labor force, while the rate of the female employment is computed as a percentage ratio of employed women to the female labor force. Consequently, the rates of the total and female unemployment are obtained by subtracting the rates of the total and female employment from one hundred (see also Charts 6–7).

Chart 7. Unemployment rates for women (%): 2006

Source: Table 4

The unemployment rates, in total and for women in particular, were high everywhere. Only for Arilje and Pancevo were they lower than for Serbia.

New enterprises

New enterprises in 2006 accounted for 11,510 in Serbia, and 953 in Cohort 2 (see Tables 5–6). New enterprises emerged, for the most part, in the private sector, which thus appeared to be the leading sector of ownership. The private sector in Cohort 2 was expanded by 911 enterprises, while all other sectors of ownership were enlarged by 42 enterprises only. Newly opened private

enterprises, distinguishable by large numbers, were those in: Pancevo (217), Sabac (145), Cacak (122), and Kraljevo (106).

The distribution of new enterprises by activities shows that the wholesale and retail trade was the most attractive sector of activity in Serbia, as well as in Cohort 2 (except for Arilje). The greatest number of new enterprises in this sector within Cohort 2 was notified for Pancevo (114).

New entrepreneurs

There were – as it might have been expected, considering the size of initial investment – more new entrepreneurs than new enterprises in 2006. New entrepreneurs amounted to 45,867 in Serbia, and 6,549 in Cohort 2 (see Table 7). The largest number of new entrepreneurs within Cohort 2 was recorded for Pancevo (1,426).

The wholesale and retail trade was again a well-favored activity by far, both in Serbia and Cohort 2 (with the exception of Arilje). It attracted 16,009 entrepreneurs in Serbia, and 2,513 entrepreneurs in Cohort 2. The greatest number of new wholesalers and retailers within Cohort 2 was reported for Pancevo (685).

Conclusion

The economic performance of the municipalities within Cohort 2 was weak in 2006, as the baseline year. In comparison with Serbia, the majority of these municipalities had a lower share of women in employment (in total, and by enterprises and entrepreneurs), and a higher share of women in unemployment. The unemployment rates, in total and for women in particular, were high everywhere. Only for two municipalities were they lower than for Serbia. At last but not the least, new enterprises and new entrepreneurs were established, for the most part, in the wholesale and retail trade – which is not crucial for the economic growth of impoverished areas.
